

Try Bayesian Survival Analysis using the JACC study data

Chaochen Wang / Aichi Medical University

2020-01-11

Data preparation

Before exclusion, we have 110585 participants (46395 men and 64190 women) in the JACC data set:

```
## # A tibble: 2 x 3
##   tr_sex      n rel.freq
##   <chr>   <int> <chr>
## 1 1       46395 41.95%
## 2 2       64190 58.05%
```

Excluding participants with conditions

1. With stroke history: n = 1496 (915 men and 581 wmen);
2. With cancer history: n = 1461 (411 men and 1050 women);
3. With myocardial infarction history: n = 2994 (1310 men and 1684 women);
4. With ischemic heart diseases history: n = 186 (91 men, 95 women);
5. With other heart diseases history (ICD9 codes: 420-429): n = 518 (204 men and 314 women);
6. Did not answer the question about milk intake frequency: n = 9545 (3593 men and 5952 women);
7. Finally, n = 94385 (39386 men and 54999 women) are left in the data:

```
## # A tibble: 6 x 4
## # Groups:   tr_sex [2]
##   tr_sex Tot_Stroke      n rel.freq
##   <chr> <chr>      <int> <chr>
## 1 1     Alive/Censor 27401 69.57%
## 2 1     I60_9         1352  3.43%
## 3 1     other_death  10633 27%
## 4 2     Alive/Censor 45672 83.04%
## 5 2     I60_9         1323  2.41%
## 6 2     other_death   8004 14.55%
```

- N of total stroke mortality (I60-I69) confirmed: 2675 (1352 men and 1323 women)
- Subtypes of stroke and CHD, heart failure:
 - Ischemic stroke: 957 (520 men and 437 women);

- Hemorrhagic stroke: 952 (432 men and 520 women);
- CHD: 1320 (749 men and 571 women);
- Heart failure: 1097 (498 men and 599 women).

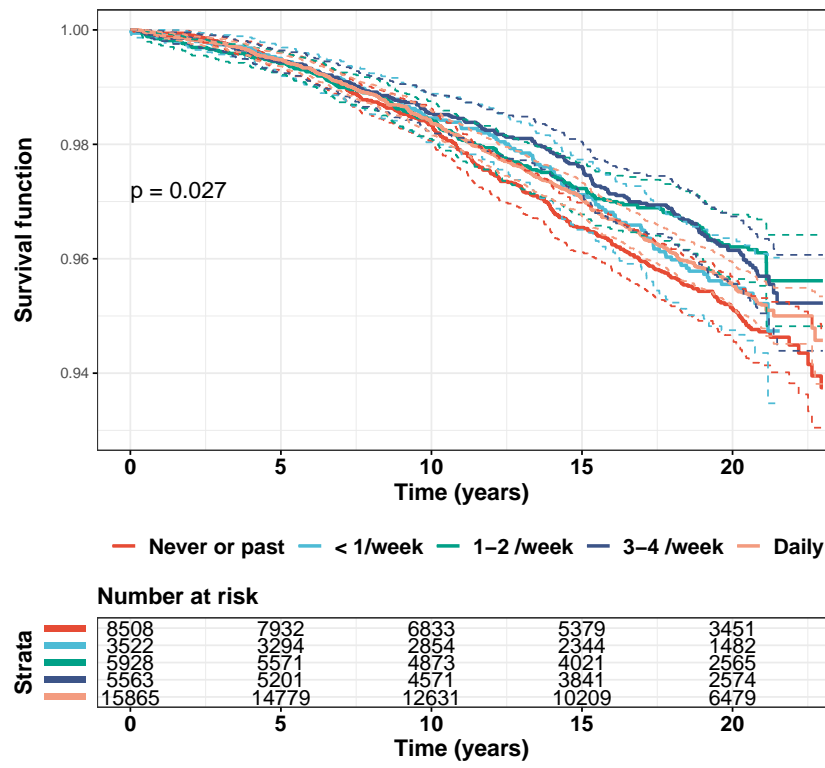

Traditional survival analysis (Cox proportional hazard model)

Table 1. Baseline characteristics of subjects in the JACC study by milk intake level in Men (n = 39,386).
